

Behind the Project

AI Job Application Tracker

A modern recruitment workspace that combines structured job application management, interview preparation and AI-assisted workflow organisation.

Project Overview

Searching for a new job often means managing dozens of applications across multiple platforms while keeping track of company information, interview preparation, salary expectations and recruitment progress.

This project was created as a concept for a modern recruitment workspace that centralises the entire job search process into one structured environment.

Instead of relying on scattered spreadsheets, notes and browser bookmarks, the application brings together application tracking, interview preparation, company research and structured documentation in a single workflow.

The goal was not only to organise information, but also to reduce cognitive overload and make every stage of the recruitment process faster, more consistent and easier to manage.

The Challenge

Modern job searching involves much more than submitting a CV.

Candidates often need to manage multiple recruitment processes simultaneously while remembering different interview stages, salary ranges, company details and preparation notes.

This project was designed to simplify that workflow by combining:

- structured application tracking
- interview preparation
- company research
- salary comparison
- recruitment status management
- searchable knowledge base
- AI-assisted information organisation

into one consistent user experience.

Design Approach

The project was built around three core principles.

Simplicity

The interface was designed to feel clean, intuitive and easy to navigate, allowing users to focus on preparing for opportunities rather than managing scattered information.

Structured Decision Making

Every job application follows the same organised structure, making it easy to compare opportunities, monitor progress and prepare consistently for interviews.

AI as a Productivity Tool

Rather than replacing human decision-making, AI is used to reduce repetitive work by organising recruitment information into structured, searchable and reusable knowledge.

Technologies

- HTML
- CSS
- JavaScript
- Local Storage
- Claude AI
- ChatGPT

Key Features

- Interactive Application Dashboard
- Job Application Tracking
- Quick Search & Filtering
- Structured Interview Preparation
- Salary Tracking
- Recruitment Status Management
- AI-assisted Quick Import
- Company Knowledge Base
- Local-first Architecture
- PDF Export

Final Thoughts

This project was created to demonstrate more than front-end development.

It showcases product thinking, workflow optimisation and practical AI integration by addressing a real-world challenge: organising complex recruitment processes into a structured, easy-to-use workspace.

The result is a productivity tool designed to help users spend less time managing information and more time preparing for meaningful career opportunities.
